1. Introduction

1.1 Background

The Department of Defense (DoD) Air Force Continuous Acquisition and Life-Cycle Support (CALS) Test Network (AFCTN) is conducting tests of the military standard for the Automated Interchange of Technical Information, MIL-STD-1840A, and its companion suite of military specifications. The AFCTN is a DoD sponsored confederation of voluntary participants from industry and government managed by the Electronic Systems Center (ESC).

The primary objective of the AFCTN is to evaluate the effectiveness of the CALS standards for technical data interchange and to demonstrate the technical capabilities and operational suitability of those standards. Two general categories of tests are performed to evaluate the standards; formal and informal.

Formal tests are large and comprehensive, which follow a written test plan, require specific authorization from the DoD, and may take months to prepare, execute, and report.

Informal tests are quick and short, used by the AFCTN technical staff, to broaden the testing base. They include representative samples of the many systems and applications used by AFCTN participants. They also allow the AFCTN staff to gain feedback from many industry and government interpretations of the standards, to increase the base of participation in the CALS initiative, and respond to the many requests for help that come from participants. Participants take part voluntarily, benefit by receiving an evaluation of their latest implementation (interpretation) of the standards, interact with the AFCTN technical staff, gain experience using the standards, and develop increased confidence in them. The results of informal tests are reported in Quick Short Test Reports (QSTRs) that briefly summarize the standard(s) tested, the hardware and software used, the nature of the test, and the results.

1.2 Purpose

The purpose of the informal test, reported in this QSTR, was to analyze NUWC's interpretation and use of the CALS standards, in transferring technical publication data. NUWC used its CALS Technical Data Interchange System to produce data, in accordance with the standards, and delivered it to the AFCTN technical staff on a 3.5" disks.

2. Test Parameters

Test Plan: AFCTB 92-095

MIL-R-28002A

3. 1840A Analysis

3.1 External Packaging

The 3.5" disks arrived at the Air Force CALS Test Bed (AFCTB) enclosed in a commercial 3.5" disk mailer. The exterior of the mailer was marked with the magnetic tape warning label, as required by MIL-STD-1840A, para. 5.3.1.3.

Enclosed in the envelope was a packing list showing all files recorded on the tape.

3.2 Transmission Envelope

The 3.5" disk received by the AFCTB contained MIL-STD-1840A files. The files were named per the standard conventions.

3.2.1 3.5" Disk Format

The files were contained on two 3.5" disks. The contents of both disks were copied to a hard disk in the AFCTB for evaluation. The files were inserted on the 3.5" disk using directory format defined in one of the early drafts of MIL-STD-1840B. The AFCTB would like to receive documents only one sub-directory down instead of the three levels.

The 3.5" disks were run through the AFCTN Tapetool v1.2.8 utility. No errors were encountered while evaluating the contents of the 3.5" disks.

3.2.2 Declaration and Header Fields

No errors were found in the Document Declaration file or data file headers. The physical structure of the 3.5" disks meet the CALS MIL-STD-1840A requirements.

4. IGES Analysis

No Initial Graphics Exchange Specification (IGES) files were included on the 3.5" disks.

5. SGML Analysis

The Text file from this document was tested using Exoterica's *XGMLNormalizer* parser. No errors were reported during this operation. The DTD consisted of three files which were parsed without a reported error.

The DTD and Text files were also parsed using ArborText's *ADEPT v4.2.1* with no reported errors.

The DTD and Text files meet the CALS MIL-M-28001A specification.

6. Raster Analysis

All 61 Raster files were checked using the AFCTN *validg4* utility. No errors were reported during this procedure.

A sample of the 61 Raster images (14) were checked using the AFCTN *calstb.475* utility. All of the images could be displayed and no problems were noted. Files R018, R033 and R038 displayed a slight angle which was inserted during the scan operation.

A sample of the Raster files were converted to an IMG format using Inset Systems' *HiJaak*. No problems were reported. The resulting files were imported into Corel's *Ventura Publisher*. The hard copies of three of the files are included in the Appendix of this report.

A sample of the files were converted using Rosetta Technologies' *Prepare*. No problems were noted. The resulting files were imported into *Preview*, displayed and printed.

An attempt was made to read the selected Raster files into IDA's *IGESView*. This program reported that the files were in error. This is a bug that has been reported to IDA.

The selected files were converted into TIFF format using ArborText's *g42tiff* utility. No problems were reported. The resulting files were read into Island Graphics' *Island-Paint*, displayed and printed.

The Raster files meet the CALS MIL-R-28002A specification.

7. CGM Analysis

No Computer Graphics Metafile (CGM) files were included on the 3.5" disks.

8. Conclusions and Recommendations

In summary, the 3.5" disks from NUWC Division Newport was correct. The 3.5" disks could be read properly using the AFCTN Tepetool Software without a reported error. The physical structure of the disks meet the CALS MIL-STD-1840A requirements.

The SGML DTD and Text files parsed without reported error. They meet the CALS MIL-M-2001A specification.

The Raster files were reported without errors and meet the CALS MIL-R-2002A specification.

The files sent to the AFCTB meet the CALS MIL-STD-1840A requirements.
